Department of Computer Science and Engineering
ASSESSMENT TOOL 2 – UI CREATION

Course Code:	ITA03	Course Title:	Mobile computing
CO Assessed:	CO5	Assessment:	AT2 – UI CREATION
Weightage:	60 % of CIA	Total Marks:	100
CO5 Statement:	Design, implement, and deploy mobile applications using appropriate development environments.		
Student Name:	I V Gowtham Kumar Reddy	Reg. No.:	192372158
Section / Batch:	CSE AI/2023	Date:	20/08/26

Code of Conduct

I I V Gowtham Kumar Reddy(192372158) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: igowthamreddy

Instructions

- Students must select one scenario from the given list and design the corresponding mobile application UI.
- The application should contain a minimum of 5 screens and a maximum of 8 screens.
- The UI should include appropriate elements such as text fields, buttons, icons, images, cards, menus, lists, and navigation components wherever required.
- Students should maintain a consistent design throughout the application with respect to colours, fonts, icons, spacing, and layout.
- The application should provide a clear navigation flow between different screens.
- The design should be simple, user-friendly, and suitable for college students.
- Each screen should have a clear purpose based on the selected scenario.
- Students should include appropriate input, selection, confirmation, and result screens wherever the scenario requires them.
- Students should consider basic usability principles, including readability, accessibility, proper alignment, sufficient spacing, and intuitive navigation.
- The UI should be designed for a mobile phone screen and should not resemble a desktop or web application.

- Students should include suitable validation or feedback messages for important user actions such as login, submission, booking, ordering, or registration.
- Students should create a logical user journey, beginning from the application's entry screen and ending with the successful completion of the main task.
- Students may use Figma, Android Studio, Flutter, Adobe XD, or any other approved UI design tool.
- Students should use dummy data wherever actual databases or APIs are not required.
- Students must submit the UI screens along with a navigation flow diagram showing how the screens are connected.

Annexure A - QUESTIONS

1. An elderly person has difficulty remembering the correct time to take different medicines. A family member wants a mobile application that displays the day's medicines and reminds the user at the appropriate time. Develop a simple and accessible UI for this situation.

UI Design Explanation: Medicine Reminder App

Problem

The target user is an elderly person who has difficulty remembering which medicine to take and at what time. A family member needs a mobile application that displays the day's medicines clearly and reminds the user at the appropriate time, without requiring complex navigation or small text.

Design Principles

- **One focal point.** The screen always highlights a single "up next" medicine at the top, so the user never has to scan or search for what to take.
- **Large text and tap targets.** Medicine names, times, and buttons are sized well above typical app defaults, with generous spacing between rows, reducing the chance of misreading or mistapping.
- **State shown two ways.** The three states — taken, due now, and upcoming — are each paired with a distinct icon and plain-language text, not colour alone. This matters because many elderly users have reduced colour vision.
- **Warm, low-glare palette.** A soft cream background with warm dark-brown text is used instead of stark white-on-black, which is gentler on ageing eyes.
- **Minimal navigation.** Everything the user needs is on one scrolling screen. The only secondary control — editing the medicine list — is tucked into a small settings icon, since that task belongs to the family member, not the daily user.
- **Plain-language reminders.** A notification names the medicine and dose and offers exactly two choices: "Take now" or "Remind me in 10 min," so the user isn't asked to make a complex decision under time pressure.

OUTPUT:

Good morning, Meera

Monday, 31 August

Due now

Blood pressure tablet

Amlodipine 5mg, 1 tablet · 9:00 am

Mark as taken

Morning

Vitamin D3

Taken · 8:02 am

Blood pressure tablet

Due now, tap to mark taken

Afternoon

Diabetes tablet

1:00 pm, not due yet

Evening

Multivitamin

6:00 pm, not due yet

Night

Cholesterol tablet

9:00 pm, not due yet

All medicines taken today 1 of 5

How the Three States Are Distinguished

State	Icon	Colour	Text
Taken	Check mark	Sage green	"Taken · [time]"
Due now	Clock	Amber	"Due now, tap to mark taken"
Upcoming	Empty outline	Neutral grey	"[time], not due yet"

Interaction Flow

Tapping a medicine's circle marks it as taken and the "up next" card automatically updates to show the next pending dose. At the scheduled time, the app would show a reminder screen naming the medicine and dose with two large buttons: "Take now" and "Remind me in 10 min."

Open Design Questions

- Should a missed dose (past due and still unmarked) have its own visual state, distinct from "due now" but not alarming?
- Should the reminder also vibrate or sound a chime, in addition to the on-screen alert?
- Should the family member be notified if a dose goes unmarked for too long?
